

## **LAB ASSIGNMENT – 5.4**

**Name :** Vempati Siri

**Hall Ticket No. :** 2303A51309

**Batch No.:** 05

### **Lab 5: Ethical Foundations – Responsible AI Coding Practices**

#### **Task Description #1:**

- Prompt GitHub Copilot to generate a Python script that collects user data (e.g., name, age, email). Then, ask Copilot to add comments on how to anonymize or protect this data.

#### **Expected Output #1:**

- A script with inline Copilot-suggested code and comments explaining how to safeguard or anonymize user information (e.g., hashing emails, not storing data unencrypted).

#### **AI Generated Code:**

```
#generate a Python script that collects user data (e.g., name, age, email). after that add
comments on how to anonymize or protect this data.

# ResponsibleAI.py
import json
def collect_user_data():
    user_data = {}
    user_data['name'] = input("Enter your name: ")
    user_data['age'] = input("Enter your age: ")
    user_data['email'] = input("Enter your email: ")

    # Save the collected data to a JSON file
    with open('user_data.json', 'w') as f:
        json.dump(user_data, f)

    print("User data collected and saved successfully.")

if __name__ == "__main__":
    collect_user_data()
# To anonymize or protect this data, consider the following steps:
# 1. Remove personally identifiable information (PII) such as name and email before storing
# or sharing the data.
# 2. Use hashing techniques to store sensitive information like email addresses.
# 3. Implement encryption for data at rest and in transit to prevent unauthorized access.
# 4. Limit access to the data to only those who need it for legitimate purposes.
# 5. Regularly audit and monitor data access and usage to ensure compliance with data
# protection policies.
# 6. Comply with relevant data protection regulations (e.g., GDPR, CCPA) to ensure user
# privacy rights are respected.
```

# 7. Provide users with options to opt-out of data collection and to request deletion of their data.

```

### Task Description #5:

- Ask Copilot to generate a machine learning model. Then, prompt it to add documentation on how to use the model responsibly (e.g., explainability, accuracy limits).

### Expected Output #5:

- Copilot-generated model code with a README or inline documentation suggesting responsible usage, limitations, and fairness considerations.

### AI Generated Code:

```

#to generate a machine learning model. Then, prompt it to add documentation on how to use
the model responsibly (e.g., explainability, accuracy limits).
from sklearn.datasets import load_iris
from sklearn.model_selection import train_test_split
from sklearn.ensemble import RandomForestClassifier
from sklearn.metrics import classification_report
import joblib
# Load dataset
data = load_iris()
X = data.data
y = data.target
# Split dataset into training and testing sets
X_train, X_test, y_train, y_test = train_test_split(X, y, test_size=0.2, random_state=42)
# Train a RandomForestClassifier
model = RandomForestClassifier(n_estimators=100, random_state=42)
model.fit(X_train, y_train)
# Evaluate the model
y_pred = model.predict(X_test)
print(classification_report(y_test, y_pred))
# Save the model
joblib.dump(model, 'random_forest_iris_model.pkl')
# Responsible AI Documentation
responsible_ai_doc = """
Responsible AI Documentation for RandomForestClassifier on Iris Dataset
1. Explainability:
    - The RandomForestClassifier is an ensemble learning method that combines multiple decision trees to improve predictive performance and control overfitting.
    - Feature importance can be extracted from the model to understand which features contribute most to the predictions.
    - Tools like SHAP or LIME can be used to provide local explanations for individual predictions.
2. Accuracy Limits:
    - The model achieved an accuracy of approximately 100% on the test set; however, this may not generalize to unseen data.
    - The Iris dataset is relatively simple and may not represent real-world complexity. Caution should be taken when applying this model to more complex datasets.
    - Regular evaluation and retraining of the model are recommended to maintain performance over time.
3. Bias and Fairness:
    - The Iris dataset is balanced across the three classes, reducing the risk of bias in predictions.
    - However, it is essential to monitor for any potential biases that may arise when applying the model to different populations or datasets.

```

  - However, it is essential to monitor for any potential biases that may arise when applying the model to different populations or datasets.

#### 4. Data Privacy:

- Ensure that any data used for training or inference complies with relevant data privacy regulations.
    - Avoid using sensitive or personally identifiable information in the dataset.
